

Emission Report

This comprehensive report examines the critical issue of CO₂ emissions from automobiles, a significant contributor to global greenhouse gas emissions. With transportation being a major source of CO₂ emissions worldwide, understanding the environmental impact of different types of vehicles is crucial for developing effective strategies to mitigate climate change.

- Recommendations:

Encourage the adoption of EVs through incentives and infrastructure development.

- Promote hybrid vehicles as a transitional solution for those unable to switch to EVs immediately.

- Implement stricter emissions standards and promote fuel-efficient technologies to reduce CO₂ emissions from gasoline vehicles.

- Conclusion: Transitioning to EVs and promoting cleaner transportation technologies is crucial for mitigating the environmental impact of car emissions and combating climate change.
